

Digital Image Processing

Lecture #6
Ming-Sui (Amy) Lee

Course Information

Following Schedule

02/25	Lecture 1	04/29	Lecture 8
03/04	Lecture 2	05/06	Proposal
03/11	Lecture 3	05/13	Lecture 9
03/18	Lecture 4	05/20	Lecture 10
03/25	Lecture 5	05/27	Lecture 11
04/01	溫書假	06/03	Lecture 12
04/08	Lecture 6	06/10	Demo
04/15	Lecture 7	06/17	Demo
04/22	Midterm	06/24	Final Package Due

Homework #2

- Due: 11:59pm, Apr. 9, 2021

Digital Halftoning

[Digital Halftoning]

■ Goal

- Render the illusion of a continuous-tone image based on two-tone (half-tone) display

- Applications

- Computer hardcopies

- Laser printers/dot-matrix printers/color printers
 - Fax machine

- Implementation

- Thresholding at 1/2 ?

Digital Halftoning

Gray-level image

Half-toned images

Digital Halftoning

Color Printer

Continuous Image

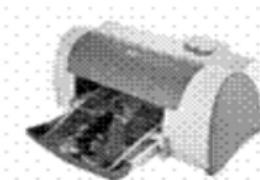

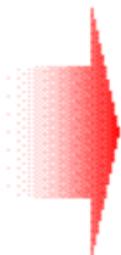

Binary Image

CMY channel

Black channel

Digital Halftoning

■ Basic idea

○ Spatial modulation

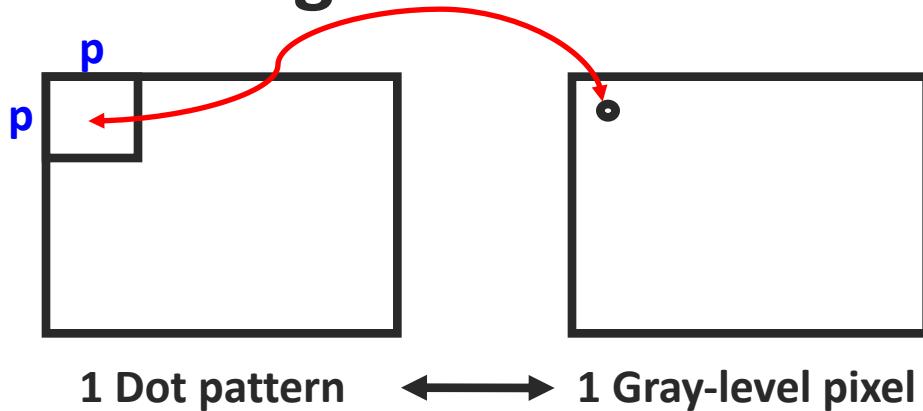

- Gray-level \leftrightarrow black/white
- Darker area \leftrightarrow denser black points per area
- Whiter area \leftrightarrow sparser black points per area

○ Three approaches

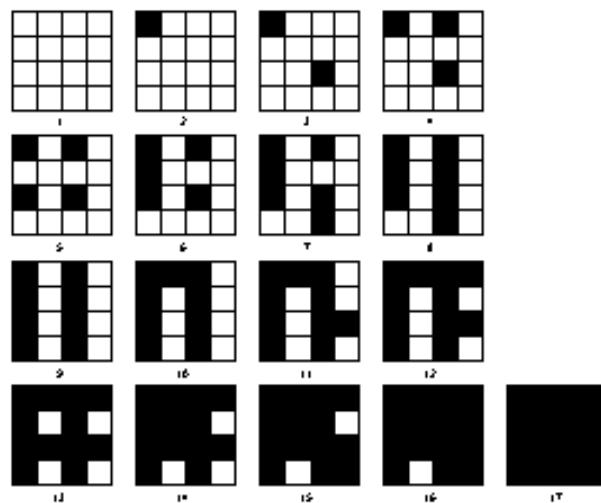

- Patterning
- Dithering
- Error Diffusion

Digital Halftoning

Patterning

If $p=4$
→ 16 binary pixels
→ 17 levels (0~16)
→ 256 gray levels
→ Quantization

Rylander's recursive patterning matrices

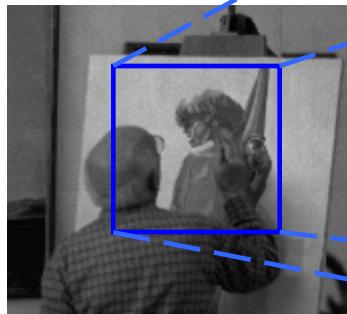

Digital Halftoning

■ Patterning

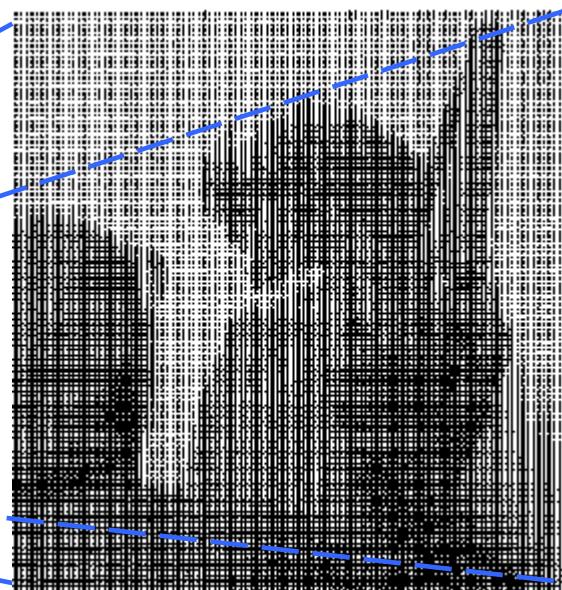

- Four steps
 - Read in the given grey-level image
 - Quantization
 - Design the patterning table
 - Map each pixel to its corresponding pattern
- Simplest way
- Generates image with higher spatial resolution than the source image

Digital Halftoning

- Patterning
 - Example

Original gray-level image

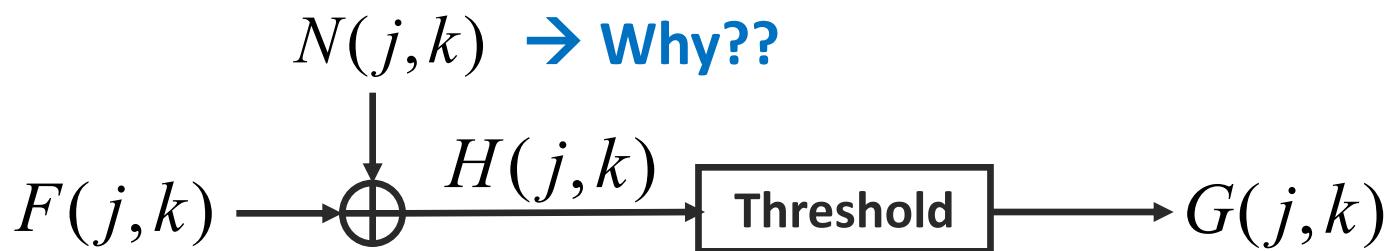

Half-toned image: patterning

Digital Halftoning

■ Dithering

- Create an image with the same number of dots as the number of pixels in the source image
- Idea

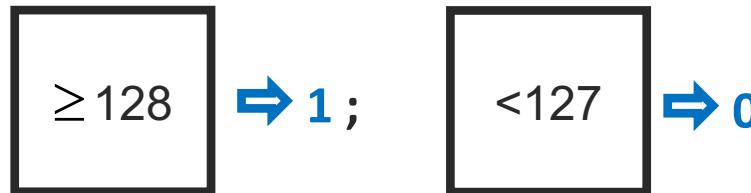

Digital Halftoning

■ Dithering

- Why adding noise?

- Under fixed thresholding → taking MSB

- E.g. before and after adding noise

- To break the monotonicity of accumulated error in the area of constant (nearly constant) gray level
 - Noise type
 - White noise, pink noise, blue noise and green noise

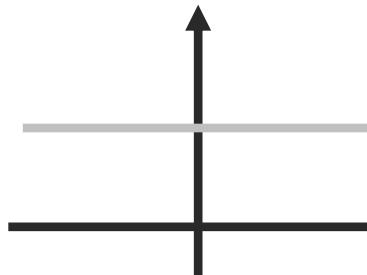

Digital Halftoning

Dithering

Noise Type

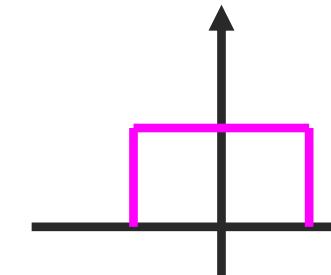

Power spectral density

White noise

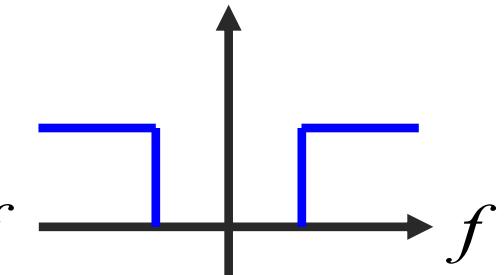

Grainy appearance

Pink noise

Low-frequency noise

Blue noise

High-frequency noise

Robert Ulichney, “Digital Halftoning”

<http://www.hpl.hp.com/people/u/>

Digital Halftoning

■ Dithering

- Adaptive thresholding

- Generate a threshold matrix according to a dither matrix
- Whenever the pixel value of the image is greater than the value in the threshold matrix, the pixel is turned on

- Notes

- No randomness
- Region-to-region mapping
- Recursive definition allowed

[Digital Halftoning]

- Dithering
 - Dither matrix

$$I_2(i, j) = \begin{bmatrix} 1 & 2 \\ 3 & 0 \end{bmatrix}; \quad I_2(i, j) = \begin{bmatrix} 3 & 1 \\ 0 & 2 \end{bmatrix}$$

- 0 → lowest threshold
- 3 → highest threshold

[

Digital Halftoning

]

■ Dithering

- The general form of the NxN dither matrix
 - 2x2 → 4x4 → 8x8 → 16x16...

$$I_{2n}(i, j) = \begin{bmatrix} 4I_n(i, j) + 1 & 4I_n(i, j) + 2 \\ 4I_n(i, j) + 3 & 4I_n(i, j) + 0 \end{bmatrix}$$

- Eg. What is $I_4(i, j)$ if $I_2(i, j) = \begin{bmatrix} 1 & 2 \\ 3 & 0 \end{bmatrix}$?

[

Digital Halftoning

]

■ Dithering

- Determine the threshold matrix

$$T(i, j) = 255 \cdot \frac{I(i, j) + 0.5}{N^2}$$

■ Eg. N=4

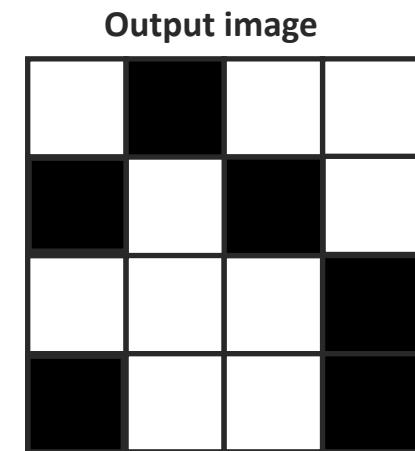

$$I_4(i, j) = \begin{bmatrix} 5 & 9 & 6 & 10 \\ 13 & 1 & 14 & 2 \\ 7 & 11 & 4 & 8 \\ 15 & 3 & 12 & 0 \end{bmatrix}, \quad T_4(i, j) = ?$$

Digital Halftoning

Dithering

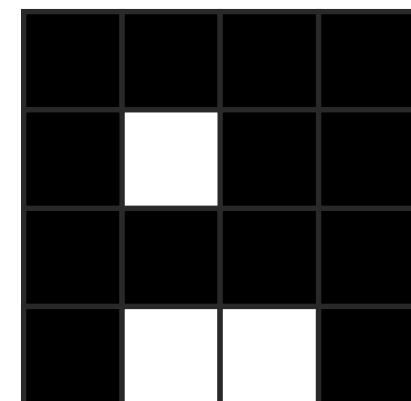

Input image			
12	51	34	121
78	254	10	97
45	113	110	16
90	200	206	34

Repeated threshold matrix			
0	60	0	60
110	110	110	45
0	60	0	60
110	45	110	45

Another repeated threshold matrix

128	128	128	128
128	128	128	128
128	128	128	128
128	128	128	128

■ Experimental results

Original Image

Dithering

Digital Halftoning

Error diffusion

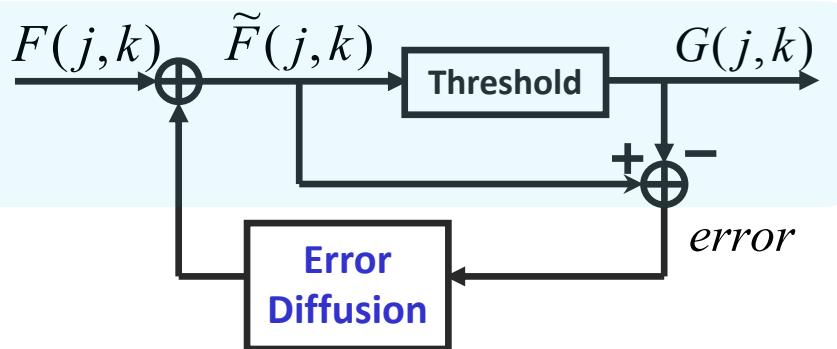

- 1975 Floyd & Steinberg
 - A practical algorithm to implement blue noise dithering
 - Framework

Digital Halftoning

Error diffusion

- Normalize $F(j,k)$ to lie between [0,1]
- Set threshold=0.5
- Output image: 0 or 1

if $\tilde{F}(j,k) \geq 0.5 \rightarrow G(j,k) = 1$

if $\tilde{F}(j,k) < 0.5 \rightarrow G(j,k) = 0$

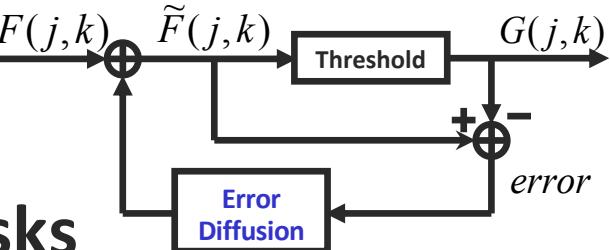

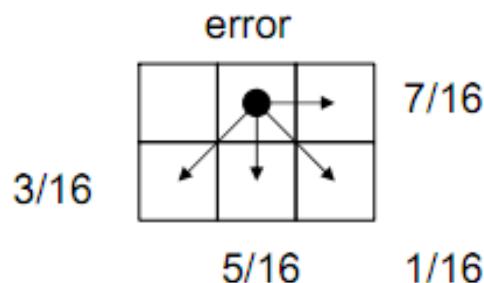

Define $E(j,k) = \tilde{F}(j,k) - G(j,k)$

Digital Halftoning

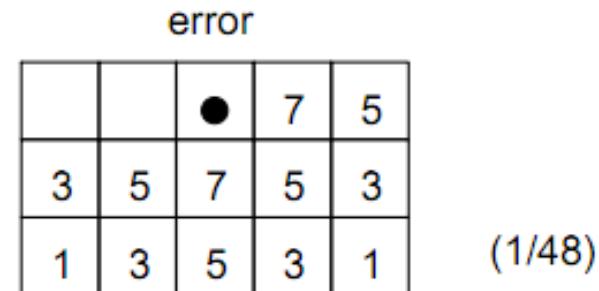

Error diffusion

- Error diffusion filter masks

 - 1975 Floyd Steinberg:

 - 1976 Jarvis et al:

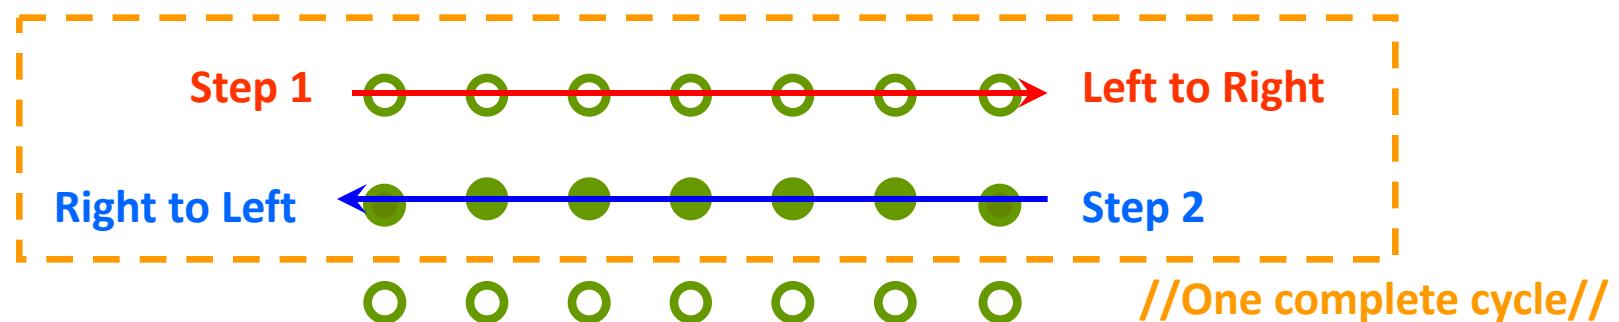

Other diffusion matrices

- <http://www.tannerhelland.com/4660/dithering-eleven-algorithms-source-code/>

Digital Halftoning

■ Error diffusion

○ Error diffusion + serpentine scanning

$$\frac{1}{16} \begin{pmatrix} 0 & 0 & 0 \\ 0 & 0 & 7 \\ 3 & 5 & 1 \end{pmatrix}$$

Left to Right

$$\frac{1}{16} \begin{pmatrix} 0 & 0 & 0 \\ 7 & 0 & 0 \\ 1 & 5 & 3 \end{pmatrix}$$

Right to Left

Digital Halftoning

Error Diffusion

Digital Halftoning

■ Experimental results

Original Image

Floyd-Steinberg

Jarvis

Digital Halftoning

- Multi-scale Error diffusion
 - Several issues
 - Region-to-region mapping
 - Multi-resolution
 - Time series/causal error diffusion process
 - Easy to implement
 - Causality appears to be artificial in images
 - Is non-causal error diffusion possible?
 - Quality metrics of half-toned images

Digital Halftoning

■ Multi-scale Error diffusion

“A multiscale error diffusion technique for digital halftoning”

Ioannis Katsavounidis and C. –C. Jay Kuo

○ Problem set-up

- Input image → $X(i, j) \in [0,1]$
- Output image → $B(i, j) \in \{0,1\}$
- Error image → $E(i, j) = X(i, j) - B(i, j)$
- Intermediate stage →

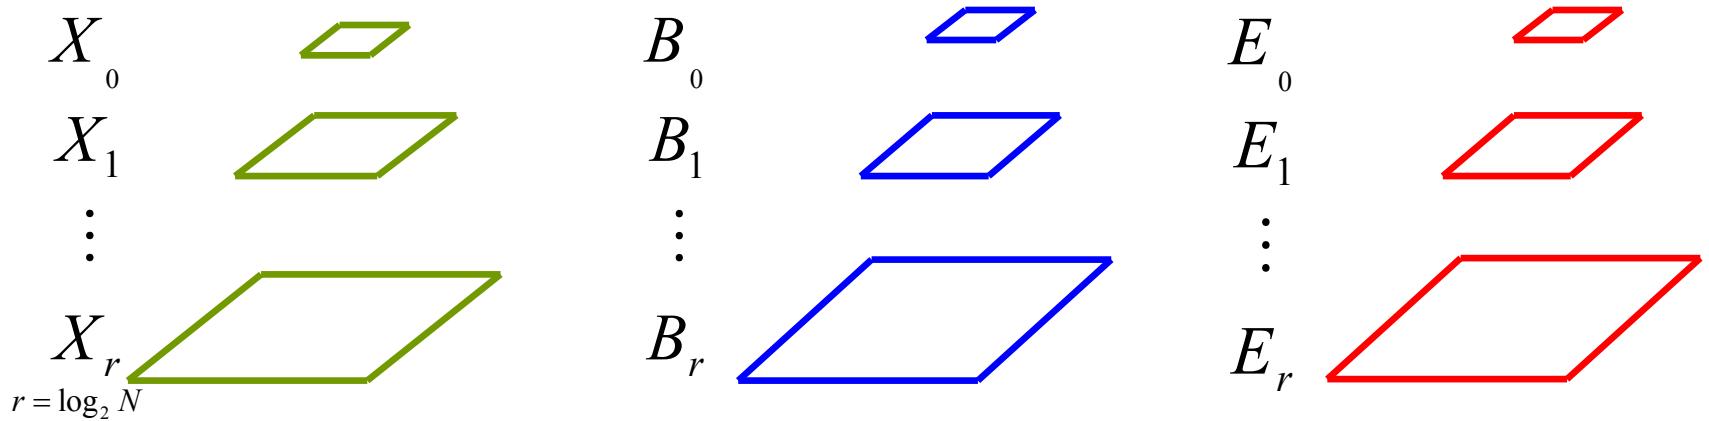

$$X_k(i_k, j_k), \quad 0 \leq k \leq r, \quad r = \log_2 N$$

$$X_k(i_k, j_k) = \sum_{i=0}^1 \sum_{j=0}^1 X_{k+1}(2i_k + i, 2j_k + j)$$

Digital Halftoning

■ Multi-scale Error diffusion

input $X(i, j) \in [0,1]$ **output** $B(i, j) \in \{0,1\}$ **error** $E(i, j) = X(i, j) - B(i, j)$

$$X_k(i_k, j_k) = \sum_{i=0}^1 \sum_{j=0}^1 X_{k+1}(2i_k + i, 2j_k + j), \quad 0 \leq k \leq r$$

$$E_k(i_k, j_k) = X_k(i_k, j_k) - B_k(i_k, j_k), \quad 0 \leq k \leq r$$

Goal: minimize the error pyramid in a certain way!

Digital Halftoning

■ Multi-scale Error diffusion

- //Step 1// Initialization

- Set the entire output image pyramid to “0”

- //Step 2// Dot assignment

- Find the largest error from top to bottom level
 - 1 parent node distributes its dots (integer numbers) to 4 children

- //Step 3// Error diffusion process

$$\frac{1}{12} \begin{pmatrix} 1 & 2 & 1 \\ 2 & -12 & 2 \\ 1 & 2 & 1 \end{pmatrix}$$

center

$$\frac{1}{8} \begin{pmatrix} 0 & 0 & 0 \\ 2 & -8 & 2 \\ 1 & 2 & 1 \end{pmatrix}$$

side

$$\frac{1}{5} \begin{pmatrix} 0 & 0 & 0 \\ 0 & -5 & 2 \\ 0 & 2 & 1 \end{pmatrix}$$

corner

Digital Halftoning

■ Multi-scale Error diffusion

- Quality management

- MSE vector

$$MSEV = \begin{pmatrix} MSE_0 \\ MSE_1 \\ \vdots \\ MSE_r \end{pmatrix} \quad MSE_k = \frac{1}{N^2} \sum_{i=0}^{2^k-1} \sum_{j=0}^{2^k-1} E_k^2(i, j)$$

- Notes

- Preserve contrast of the original image
 - Does not over-smooth the image
